

Support & Resistance, On One Page

The working rules from Course 1, compressed to a sheet you can keep beside the charts. Print it. When a trade idea breaks one of these, that's the idea telling you something.

THE SIX RULES

- 1 Levels are zones, not lines**
Price doesn't respect a number to the pip. Draw a band a few pips wide and treat everything inside it as 'at the level'.
- 2 Fewer levels, more meaning**
If your chart has nine horizontal lines, none of them matter. Keep the two or three levels price has reacted to repeatedly — delete the rest.
- 3 Touches build the case**
A level that turned price twice is a suspicion. Three or more times, across sessions, and it's a level worth planning around.
- 4 Role reversal is the tell**
Broken support tends to act as resistance on the retest, and vice versa. The retest is often the cleaner entry than the break itself.
- 5 Mark the higher timeframe first**
Daily levels outrank 4-hour levels outrank 15-minute levels. Draw top-down, then trade the small chart inside the big chart's map.
- 6 The reaction is the information**
A level doesn't predict anything. What price DOES at the level — rejection wick, stall, clean break — is the signal. Wait for it.

THE THREE WAYS TRADERS DONATE MONEY AT LEVELS

- ✗ No level, no trade**
If you can't say which level the idea is built on, there is no idea.
- ✗ Stops go beyond the zone**
A stop inside the zone is a donation. Beyond the far edge, plus spread, or don't take it.
- ✗ The break you chase is the one that fails**
Breakout candles love a retrace. Plan the retest; don't buy the top of the spike.

The one-line version: draw fewer levels, wait for the reaction, put the stop where the idea is actually wrong. Everything in the full ebook is these three sentences, taught properly.
